Diagnostics & Recovery

Diagnostics & Recovery

Useful server-side diagnostic exports:

```
AuditVehicleTypes()
ReconcileImpounds(options)
GetRecoveryCenter()
RepairVehicleState(value, action, garage, actor)
GetVehicleGarageState(plate)
GetStaffVehicleSnapshot(limit)
SyncAllFrameworkVehicles(limit, force)
GetProviders()
```

Recovery Center examples

Recovery can address stale transient states and missing/incompatible garage assignments through the normal state synchronization flow.

Production logging

Keep `Config.Debug = false` normally. Enable it only while reproducing a problem, collect the relevant console output, then disable it again.

What runtime testing must cover

Static validation cannot reproduce every combination of framework build, MLO geometry, OneSync ownership migration, fuel/key version or existing database contents. Always perform a staging smoke test before replacing a busy live resource.
