

Lifecycle Editor

The Item Management **Lifecycle** page controls durability and shelf life.

Durability fields

- Enabled.
- Starting durability.
- Loss per successful use.
- Healthy bar color.
- Destroy at zero behavior in the normalized definition.

Enabling durability automatically forces the item to unique/non-stackable behavior and prevents normal `remove = 1` consumption from bypassing wear.

Expiration fields

- Enabled.
- Duration value/unit in the Admin UI.
- Expiry color.

Internally, expiration is stored as seconds and converted to an instance `expiresAt` timestamp.

Base item overrides

Lifecycle settings can be applied to a base/reference item through Admin Studio. Nord creates a DB-backed override and leaves the Lua reference untouched.

Use **Revert to base** to remove the DB override and restore the file definition.
