

Server Exports · Metadata & Inventory Management

Metadata

```
exports.nord_inventory:SetMetadata(target, slot, metadata)
exports.nord_inventory:GetMetadata(target, slot)
exports.nord_inventory:UpdateMetadata(target, slot, patch)
```

`SetMetadata` replaces the slot metadata with the supplied object after normalization/sanitization.
`UpdateMetadata` patches fields.

Inventory capacity

```
local ok = exports.nord_inventory:SetMaxWeight(target, 200000)
local ok, reason = exports.nord_inventory:SetSlotCount(target, 80)
```

`SetSlotCount` refuses to shrink below a currently occupied slot and can return `inventory_full`.

Clearing

```
exports.nord_inventory:ClearInventory(target)
```

Keep one or more item names:

```
exports.nord_inventory:ClearInventory(target, { 'radio', 'phone' })
```

Remove from runtime cache

```
exports.nord_inventory:RemoveInventory(target)
```

Persistent inventories are saved before being removed from the runtime cache.
